No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         c was obtained which reacted with outer membrane proteins. The antibody was used to identify the genes (see AAW06816-27) encoding comp4-Omp15 proteins (see AAW068417-28) in an expression library of C. pneumoniae DNA. The genes are situated in 2 gene clusters:

Omp12,11,10,5,4,13 and 14 in one cluster and Omp6,7,8,9 and 15 in the other, and encode polypeptides of about 89,6-100.3 kDa and 20 about 56.1 kDa. The invention provides a new species specific test for identifying mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for Omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by pCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The mammals, the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                             The present sequence represents the complete genome of Chlamydia pneumoniae, and encodes proteins AAY34584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3001

                                                                                                                                                                                                                           The present sequence is that of Chlamydia pneumoniae genomic DNA including an open reading frame that codes for CPN100877 RY-61 (see AAY95548), a putative 98 kba outer membrane protein. It is an example of C. pneumoniae polynucleotide molecules of the invention (see AAA50030-42) that encode antigenic polypeptides (see AAY95543-55) useful in the diagnosis, treatment and prevention of Chlamydia infection. The polynucleotides can be utilised: in the recombinant production of Chlamydia antigens using transformed unicellular host cells; in vaccines or live vaccine vectors; in naked form or formulated with a delivery vehicle for therapy and prophylaxis of Chlamydia infection; and as probes or primers for diagnosis of Chlamydial

> This DNA sequence encodes the novel surface exposed protein Omp6 (see AAW88430) of Chlamydia pneumoniae, a human respiratory pathogen. It is described as a subsequence of a claimed nucleic acid fragment (see AAX06818) encoding omp6 (see AAW88419). The invention provides a new species specific test for identifying mammals (including humans) infected with C. pneumoniae. The test comprises detecting antibodies specific for surface exposed proteins Omp4-Omp15 (see AAW88417-28) or detecting nucleic acid fragments encoding them (see AAW88417-28), especially by PCR. The proteins are also used in the diagnosts of C. pneumoniae infection in mammals. The nucleic acids and proteins can also be used in the immunization of mammals, the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.

and intranssally into mice, which were subsequently inoculated with Chlamydia pneumoniae. The chlamydial lung titers of the immunised mice were lower than those of the controls. Thus the 98kba putative outer membrane protein can be used as a vaccine to provide protection against Chlamydia infections, especially Chlamydia pneumoniae infections. The polypeptide may also be administered orally to treat Chlamydia infection. The present sequence may also be used in the construction of attenuated Chlamydia strains that can over-express the gene or express it in a non-toxic form. The present sequence is the 98kDa putative outer membrane protein gene from Chlamydla pneumoniae. The genomic sequence was amplified using two PCR primers. The 5' primer contains a NotI restriction site, a ribosome binding site, an initiation codon and a sequence close to the 5' end of the 98kDa putative outer membrane protein coding sequence. The 3' primer contains the sequence encoding the C-terminal sequence of the putative outer membrane protein and a BarGl restriction site. The stop codon was excluded and an additional nucleotide was inserted to obtain an in-frame c-terminal fusion with the Histidine tag. The PCR product was cloned into a eukaryotic expression vector (pCA-Myc-His) by restricting both the vector and the PCR product with NotI and BamHl and performing a ligation reaction. This expression vector was injected intramuscularly and intramascularly into mice which were enhancemently incrulated with

The invention provides a new species specific test for identifying mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for Omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, and the content of t
